The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Hexadecenoic Acid competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Hexadecenoic acid (HCA) is a 16-carbon, single-bonded unsaturated fatty acid, belonging to the monounsaturated fatty acid (MUFA) family. In nature, it primarily exists in the cis form. Commonly found in seaweed, fish oil, vegetable oils, and animal fats, it is an important component of lipids in organisms, exhibiting good biocompatibility and chemical reactivity. It is widely used in cosmetics, pharmaceutical intermediates, food additives, and surfactants. The HCA industry chain primarily involves upstream raw material oils (such as palm oil, seaweed oil, and animal fats) through processes like hydrolysis, fractionation, catalytic hydrogenation, or unsaturated fatty acid separation to obtain midstream HCA raw materials, which are then processed into high-purity products. Downstream applications include cosmetic emollients, pharmaceutical intermediates, nutritional supplements, lubricants, surfactants, and specialty chemical materials, forming a complete value chain from natural oil extraction to fine chemical applications. In 2024, global HCA production reached 394 tons, with an average selling price of US\$132 per kilogram. The HCA industry's gross profit margin is approximately 42%.

The global Hexadecenoic Acid market size was estimated at USD 52.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.60% during the forecast period.
