Abstracts

Hexafluoroacetone hydrate is a highly fluorinated organic compound derived from hexafluoroacetone, where the carbonyl group is stabilized by the formation of a geminal diol structure through hydration. This compound is characterized by its strong electrophilic properties, thermal stability, and reactivity, making it a valuable intermediate in specialized chemical syntheses. It is primarily utilized in the production of high-performance polymers, pharmaceuticals, agrochemicals, and advanced materials, where its unique fluorine content imparts desirable properties such as chemical resistance, low surface energy, and enhanced durability. The hydrate form is often preferred in handling and reactions due to its reduced volatility and improved stability compared to anhydrous hexafluoroacetone.

The global Hexafluoroacetone Hydrate market size was estimated at USD 78.25 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.
