## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Hexagonal Manganite competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Hexagonal manganite refers to a family of rare-earth manganite compounds with the general formula  $RMnO_3$  (R = Y, Sc, In, or heavy rare-earth elements such as Ho, Er, Yb, Lu) that crystallize in a non-centrosymmetric hexagonal structure, exhibiting notable multiferroic properties—simultaneous ferroelectricity and antiferromagnetism—making them valuable for spintronics, nonlinear optics, sensors, and next-generation memory devices. The supply chain begins with rare-earth oxides ( $Y_2O_3$ ,  $Ho_2O_3$ ,  $Er_2O_3$ , etc.) and manganese oxide precursors, followed by solid-state synthesis, sol-gel processing, or floating-zone crystal growth to form powders, ceramics, or single crystals. Upstream suppliers include rare-earth mining and refining companies, while midstream producers specialize in high-purity oxide blending, calcination, sintering, and crystal pulling, and downstream players convert the material into targets, substrates, thin films, and functional components for electronics companies, research institutions, and advanced materials manufacturers. In 2024, global Hexagonal Manganite output reached 19,000 tons, with 26,000 tons of annual capacity. Prices ranged USD 42,000–96,000 per ton, and producers maintained an average 34% gross margin.

The global Hexagonal Manganite market size was estimated at USD 872.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.40% during the forecast period.
