Report Overview

A hexapod is a robotic manipulator capable of moving a payload in all six degrees of freedom: lateral, longitudinal, and vertical translations as well as roll, pitch, and yaw rotations. Hexapods can allow a payload, such as an optic or laser source, to be precisely aligned and oriented relative to another object even as thermal or other forms of drift continually create misalignment. They can be used for space vehicle docking systems, munitions loading, assembly line positioning, surgical systems, and end effectors for serial manipulators.
