Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on HgCdTe Cooled Infrared Detector competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, the global mercury cadmium telluride (HgCdTe) cooled infrared detector market will have a unit price of US\$9,160 per unit, with sales of approximately 74,000 units. HgCdTe cooled infrared detectors are core components for high-performance infrared thermal imaging. They require deep cooling to reduce noise, enabling high-sensitivity and high-resolution infrared radiation detection. They are widely used in military, aerospace, and high-end scientific research fields. Continuous technological advancements consolidate core market position. In the future, the HgCdTe material system will continue to evolve toward larger array sizes, smaller pixel sizes, and higher operating temperatures (HOTs). Improving material uniformity and yield through techniques such as molecular beam epitaxy (MBE) is central to its technological evolution. These advancements will further strengthen its irreplaceable position in ultra-high-performance applications, particularly in cutting-edge fields such as space remote sensing, missile guidance, and astronomy. Cost Control and Diversified Applications Despite facing competition from uncooled detectors and other cooled technologies (such as type-II superlattices), HgCdTe detector costs are expected to gradually decrease through improved production processes and large-scale manufacturing. This will drive its expansion from purely defense applications into high-end civilian applications such as environmental monitoring, industrial process control, scientific research, and medical diagnostics, finding new growth areas. System Integration and Intelligent Development Future detectors will no longer be standalone components, but rather part of an "on-a-chip optoelectronic system." Tighter integration of readout circuit (ROIC), digital processing and intelligent algorithms enables on-chip

information extraction and compression, significantly improving system performance, reducing size and power consumption to meet the needs of a new generation of portable, intelligent infrared equipment.

The global HgCdTe Cooled Infrared Detector market size was estimated at USD 679.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.30% during the forecast period.
