Report Overview

HID plant light supplement equipment refers to the use of high-intensity discharge lamps as light sources for plant growth lighting. It is used to provide supplementary lighting for indoor plants. HID lighting is commonly used in commercial greenhouses and indoor gardening. HID plant light supplement equipment typically uses two main types of bulbs: metal halide (MH) lamps and high-pressure sodium (HPS) lamps. These bulbs emit high-intensity light and provide the necessary spectrum for plant growth, including blue and red light. Metal halide lamps primarily emit blue light and are suitable for the vegetative growth stage of plants, such as seed germination, seedling growth, and leaf development. They produce a spectrum similar to natural sunlight, which helps promote healthy plant growth and chlorophyll synthesis. High-pressure sodium lamps primarily emit red light and are suitable for the flowering and fruiting stages of plants. Red light promotes flowering and fruit ripening, which can increase yield and quality. HPS lamps also have high light efficiency and are more energy-efficient.

The global Hid Plant Light Supplement Equipment market size was estimated at USD 485.2 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 12.45% during the forecast period.
