In 2024, global production of high-availability servers reached 300,000 units, with an average selling price of US\$5,000 per unit. Production capacity was 350,000 units, with a gross margin of 20%. High-availability servers are groups of systems that support the server applications that can be reliably utilized with a minimum amount of downtime. These servers are operated using high-availability software to harness the redundant computers that provide continued service when the server components fail. Without high-availability software, if a server is running a particular application and crashes, the application is unavailable until the server is restored or fixed.

The global High-Availability Server market size was estimated at USD 1500.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.40% during the forecast period.
