## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on High Build Rust Stabilizer with Reinforced Glass Flake Coating competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. A high build rust stabilizer with reinforced glass flake coating is a thick-film anti-corrosion coating that combines a high-solids resin system with high-aspect-ratio glass flake fillers. It is specifically designed for long-term rust and corrosion protection of steel structures. Its core principle is to form a dense "palace-like overlapping structure" within the coating through the glass flakes, significantly extending the penetration path of corrosive media while stabilizing the rust layer and inhibiting further oxidation. This product offers excellent chemical resistance, water resistance, abrasion resistance, and adhesion, making it suitable for heavy-duty corrosion protection applications in harsh environments, such as marine engineering, petrochemicals, and metallurgical equipment. Compared to traditional anti-rust primers, this product can be applied directly onto rusted substrates, reducing pretreatment costs, improving application efficiency, and increasing protection lifespan. The glass flake coating market is undergoing a critical phase of performance upgrades and structural optimization. The current raw material price of glass flakes is approximately US\$3.8 per kilogram, and the typical addition ratio to the coating is 10%–35%, resulting in a product gross profit margin ranging from 35% to 55%. Annual production capacity per production line in the industry generally ranges from 12 million to 30 million square meters. High-solid systems, while offering slightly lower capacity, offer higher added value. The glass flake coating market is at a critical stage of performance upgrades and structural optimization. The upstream supply chain primarily relies on raw materials such as medium-alkali or alkali-free glass, epoxy and vinyl ester resins, additives, and

solvents, with fine chemical and glass material companies forming the core supply chain. The downstream sector encompasses industries such as marine engineering, petrochemicals, metallurgy, power generation, and infrastructure, which require extremely high long-term corrosion protection. Steel structures and concrete components are the primary substrates used. Future development trends will focus on multifunctional composite systems (such as glass flake + ceramic powder + nanofiller), environmentally friendly low-VOC systems, and the accelerated promotion of domestic substitution, particularly in the marine engineering and infrastructure sectors. At the same time, technological innovation is driving flake size control and optimized dispersion, significantly improving coating density and protective life.

The global High Build Rust Stabilizer with Reinforced Glass Flake Coating market size was estimated at USD 433.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.70% during the forecast period.
