## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on High Carbon Alcohol Defoamer competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Higher alcohol defoamers are water-dispersible emulsions based on long-chain fatty alcohols (such as octanol, decanol, and dodecanol) as their primary active ingredients. Leveraging the low solubility and strong surface activity of higher alcohols in aqueous phases, they rapidly spread across the foam film, destabilizing it and achieving rapid foam breakdown and sustained foam suppression. These defoamers are non-toxic, environmentally friendly, biodegradable, and minimally disruptive to subsequent processes. They are widely used in water-based systems such as papermaking, fermentation, water treatment, food processing, and chemical synthesis, and are particularly well-suited for industrial applications requiring high residual defoamer content. In 2024, the global production of higher carbon alcohol defoamers will reach 134,130 tons, with an average selling price of US\$1,361 per ton. As an environmentally friendly and biodegradable defoaming product, higher alcohol defoamers are currently widely used in papermaking, fermentation, food processing and water treatment. With their advantages of being non-toxic, low in residue and environmentally friendly, they have become an important alternative to traditional silicone defoamers. The current development status shows a trend towards product serialization and compounding. By compounding with polyethers, fatty acid esters and other ingredients, their defoaming and anti-foaming properties under high temperature, high alkali or strong shear conditions have been significantly improved. Future development trends focus on developing highly active and multifunctional modified higher alcohol derivatives, optimizing emulsification processes to enhance dispersibility and stability, and combining green chemistry concepts to promote clean production to

meet increasingly stringent environmental regulations and the demand for sustainable additives in high-end industrial fields.

The global High Carbon Alcohol Defoamer market size was estimated at USD 183.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.30% during the forecast period.
