Report Overview

High content analysis systems are also known as cellomics or high-content screening, is a method that is used in biological research to identify substances such as peptides, small molecules and other related substances. Further, it can be used for preclinical drug discovery pipeline such as companion diagnostics and to identify and validate new drug target to predict in vivo toxicity. Besides, high content analysis systems allow a researcher to measure many features of organism once as compared to traditional high content analysis systems which has a single read out activity. In addition, various techniques such as automated imaging and fluorescent microscopic imaging are used to investigate cellular events such as cell viability, GPCR activity, apoptosis and many others. This, in turn, is expected to increase the demand for high content analysis systems.
