Abstracts

A high current photorelay is an optically isolated solid-state switching device designed to handle substantial electrical loads, typically ranging from several amperes to tens of amperes, using an infrared LED to activate a photosensitive semiconductor output stage such as a power MOSFET or thyristor. Unlike conventional electromechanical relays or lower-capacity optocouplers, these components provide silent, bounce-free operation with high noise immunity, long life, and fast switching speeds, making them suitable for applications requiring robust, reliable control of high-power AC or DC circuits without physical contact. They are characterized by their ability to isolate low-voltage control signals from high-voltage, high-current load circuits, ensuring safety and reducing electromagnetic interference in demanding industrial, automotive, and power management systems.

The global High Current Photorelay market size was estimated at USD 250.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.50% during the forecast period.
