Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on High-Efficiency PV Module competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. High-efficiency PV modules are solar power generation units utilizing advanced technologies such as PERC, TOPCon, and HJT, with conversion efficiency exceeding 21.5%. Featuring higher power density and superior temperature coefficients, these modules significantly improve light energy conversion efficiency and reduce system power generation costs through precise cell structure design and advanced material processes, making them the mainstream product in the global PV market. According to the latest industry data, the global PV module market reached approximately \$19,850 million in 2024, with high-efficiency modules accounting for about 85% of the market. The annual installation of high-efficiency modules was about 380 GW, with the average price dropping to \$0.26 per watt. Due to accelerated technological iteration and overcapacity, industry gross margins have been compressed to 8%-12%, while single-line annual production capacity remains at 2-3 GW.

The global High-Efficiency PV Module market size was estimated at USD 19850.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.50% during the forecast period.

This report offers a comprehensive and in-depth analysis of the global High-Efficiency PV Module market, covering all critical facets from a broad macroeconomic overview to detailed micro-level insights.
