### Report Overview:

A superconducting magnet is an electromagnet made from coils of superconducting wire. They must be cooled to cryogenic temperatures during operation. In its superconducting state the wire has no electrical resistance and therefore can conduct much larger electric currents than ordinary wire, creating intense magnetic fields. Superconducting magnets can produce greater magnetic fields than all but the strongest non-superconducting electromagnets and can be cheaper to operate because no energy is dissipated as heat in the windings. They are used in MRI machines in hospitals, and in scientific equipment such as NMR spectrometers, mass spectrometers, fusion reactors and particle accelerators. High Field usually means >2T.

The Global High Field Superconducting Magnets Market Size was estimated at USD 563.16 million in 2023 and is projected to reach USD 780.94 million by 2029, exhibiting a CAGR of 5.60% during the forecast period.
