Report Overview

High Flow Oxygen Therapy (HFOT) is a medical treatment that delivers oxygen at higher flow rates than conventional oxygen therapy, typically ranging from 20 to 60 liters per minute, while also providing heated and humidified air to enhance patient comfort and efficacy. This therapy is particularly beneficial for patients with acute respiratory failure, chronic obstructive pulmonary disease (COPD), or other conditions requiring enhanced oxygenation without invasive mechanical ventilation. HFOT systems, such as high-flow nasal cannula (HFNC) devices, are designed to improve oxygenation by reducing dead space ventilation, providing positive airway pressure, and maintaining optimal humidity levels, which helps prevent mucosal drying and improves patient compliance. The technology is increasingly adopted in hospitals, emergency departments, and home care settings due to its non-invasive nature, reduced risk of complications, and ability to bridge the gap between standard oxygen therapy and mechanical ventilation.

The global High Flow Oxygen Therapy market size was estimated at USD 614.62 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of -5.15% during the forecast period.
