Abstracts

A high frequency duplexer is a specialized passive electronic component designed to allow bidirectional communication over a single transmission path by simultaneously separating and combining transmit and receive signals operating at different frequencies within the high frequency (HF) band, typically ranging from 3 to 30 MHz. It functions through the use of filters—often bandpass or band-reject configurations—that isolate the transmit frequency from the receive frequency with high selectivity and minimal insertion loss, ensuring that the powerful outgoing signal does not interfere with or damage the sensitive receiver circuitry while maintaining signal integrity and system efficiency in demanding communication environments.

The global High Frequency Duplexer market size was estimated at USD 450.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.20% during the forecast period.
