Abstracts

High frequency electrosurgical units, commonly referred to as electrosurgical generators or simply electrotomes, are advanced medical devices that utilize high-frequency alternating electrical currents to cut, coagulate, desiccate, or fulgurate tissue during surgical procedures, enabling precise incisions with minimal blood loss through the principle of thermal ablation, where controlled electrical energy is converted into heat at the target site. These systems typically consist of a generator unit, active electrodes (e.g., blades, loops, or needles), a dispersive electrode (return pad), and foot or hand controls, and are widely employed across various surgical specialties?including general surgery, gynecology, urology, orthopedics, and neurosurgery?due to their ability to improve surgical efficiency, reduce operative time, and enhance patient outcomes by minimizing tissue trauma and bleeding.

The global High Frequency Electrotomes market size was estimated at USD 460.2 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.85% during the forecast period.
