Abstracts

A High Frequency Grinder is a grinder connected to a high-frequency generator (inverter power supply) that enhances pressure. Basically, it has a high output, which makes it suitable for steel and uneven material surfaces. In addition, with general grinders, high friction on the surface to be ground causes a decrease in rotational speed, resulting in uneven grinding. A high-frequency grinder, however, is capable of maintaining a constant output voltage, which is another feature that allows for uniform grinding. Handheld types are the mainstream, and there is no significant difference in disc size. On the other hand, work capacity varies greatly depending on the specifications of the inverter power supply.

The global High Frequency Grinder market size was estimated at USD 389.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.50% during the forecast period.
