Report Overview

Copper Clad Laminate (CCL) is made by impregnating the reinforcing material with resin adhesive, drying, cutting, and stacking the blank, then covering it with copper foil, using steel plate as a mold, and forming it in a hot press under high temperature and high pressure. As the main raw material for printed circuit boards, copper clad laminates are only used in the manufacture of printed circuit boards, and their terminal applications are extensive, including communications, consumer electronics, Automotives, military aviation, etc. According to the mechanical rigidity, copper clad laminates can be divided into two categories: rigid copper clad laminates and flexible copper clad laminates. Rigid copper clad laminates are copper clad laminates that are not easy to bend and have a certain hardness and toughness; flexible copper clad laminates are made of flexible reinforcing materials (films) covered with electrolytic copper foil or rolled copper foil. Their advantage is that they can be bent, which is convenient for the assembly of electrical components. According to the reinforcement materials used, commonly used rigid copper clad laminates can be divided into three categories: glass fiber cloth-based copper clad laminates, paper-based copper clad laminates and composite-based copper clad laminates. High-frequency copper-clad laminate refers to a copper-clad laminate with an operating frequency above 5GHz, suitable for ultra-high frequency fields, and has ultra-low loss characteristics (ultra-low signal transmission loss). High-speed copper clad laminate refers to the application at high frequency, with high signal transmission speed (10-50Gbps), high characteristic impedance (Z_0) accuracy, low transmission signal dispersion (less bias circuit distribution), low loss (D_f at 0.005-0.01) copper clad laminate. High-speed and high-frequency copper-clad laminates are realized based on glass fiber cloth-based CCL by using different types of resins. The core requirements are low D_k and low D_f . The more

stable Dk and Df, the better the high-frequency and high-speed performance.
