Report Overview

High frequency induction welding or HF welding or HF induction welder is a form of welding that uses the electromagnetic induction to heat any work piece. The welding apparatus in high frequency induction welder or HF welder or HF induction welder contains an induction coil that is energized with a radio electric current rapidly. This generates a high-frequency electromagnetic field that acts on either an electrically conductive or a ferromagnetic work piece. In an electrically conductive work piece, the main heating effect is resistive heating, which is caused due to induced currents called eddy currents. In a ferromagnetic work piece, the heating is caused mainly by hysteresis, as the electromagnetic field repeatedly distorts the magnetic domains of the ferromagnetic material.

The global High Frequency Induction Welding Machine market size was estimated at USD 385.42 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
