Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on High Frequency LCP Films competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. High-frequency substrate LCP film is a high-performance material with low dielectric constant, low dielectric loss, low water absorption and excellent dimensional stability. It is mainly used as a substrate for 5G high-frequency and high-speed communications. It is an ideal choice to replace traditional PI and MPI materials and meet the needs of 5G millimeter-wave high-frequency applications. High-frequency substrate LCP film will replace PI and MPI to become a revolutionary core material for 5G high-frequency millimeter waves. It is the preferred material for millimeter-wave frequency antennas and high-frequency terminal applications above 20GHz. It is also the only key raw material required for automotive high-frequency transmission lines, antennas, high-frequency substrates, and millimeter-wave radars above 77GHz/79GHz. It is in an irreplaceable position in the developing millimeter-wave application terminal products. With the promotion of 5G communication and the increasing improvement of smartphone technology, the penetration rate of LCP-based antennas in 5G mobile phones has also been increasing, from 9% in 2018 to 15% in 2020, and is expected to reach more than 35% in 2025. With the dual benefits of increased equipment production and increased LCP material penetration, the demand for LCP antennas is about to enter a period of dividend development, and drive the production capacity demand for LCP film resins and LCP films.

The global High Frequency LCP Films market size was estimated at USD 1100.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 13.40% during the forecast period.
