## Abstracts

High Frequency Line Traps, also known as line traps or wave traps, are specialized inductive devices installed in high-voltage power transmission systems to block high-frequency carrier signals?typically in the range of 30 to 500 kHz?used for power line carrier (PLC) communication, while allowing the power frequency current (50/60 Hz) to pass through unimpeded, thereby enabling reliable communication, protection, and control functions across electrical grids without interference from the fundamental power frequency. These components are critical in modern power systems for facilitating supervisory control and data acquisition (SCADA), teleprotection, metering, and other telecommunication applications over existing high-voltage infrastructure, ensuring both operational efficiency and grid stability.

The global High Frequency Line Traps market size was estimated at USD 180.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.25% during the forecast period.
