Report Overview

The High-Frequency Responder (HFR) is a type of geophone that is designed to be highly sensitive to high-frequency seismic signals. It is used in seismic exploration to detect small-scale geological features and to improve the resolution of seismic images. HFRs are typically used in arrays to provide detailed seismic imaging of the subsurface. They are also used in earthquake monitoring to detect and locate small earthquakes that may not be detected by other seismic sensors. HFRs have a higher natural frequency response than traditional geophones, which allows them to detect and record higher frequency seismic signals.
