Abstracts

High-hardness water corrosion and scale inhibitors are a type of chemical substance specifically used to prevent metal corrosion and scale formation in high-hardness water (hard water). High-hardness water usually refers to water containing more calcium and magnesium ions. Under such water conditions, scale is easily formed on the surface of equipment, resulting in reduced heat exchange efficiency, pipe blockage and other problems. High-hardness water corrosion and scale inhibitors form a protective film on the metal surface through different mechanisms to prevent the intrusion of corrosive media and prevent the formation of scale, thereby extending the service life of the equipment and improving the operating efficiency of the system.

The global High Hardness Water Corrosion and Scale Inhibitor market size was estimated at USD 119.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.60% during the forecast period.
