Report Overview:

Precursors are the main raw materials for semiconductor thin film deposition processes, and are mainly used in vapor deposition (including PVD, CVD, and ALD) to form various thin film layers that meet the requirements of semiconductor manufacturing. Precursors can be divided into high-k precursors, low-k precursors, silicon oxide and silicon nitride precursors, metal and metal nitride precursors, etc.

High dielectric constant precursor (High-k): Mainly used in 45nm and below semiconductor manufacturing process, used in CVD and ALD deposition technology of memory and logic chips to form capacitive dielectric or gate dielectric in integrated circuits, to solve the problem of device scaling and leakage, which can reduce leakage to about 10 times that of traditional processes and greatly improve yield; it can also be applied to flexible OLED ALD processes to protect organic light-emitting materials from oxygen and water vapor, and improve overall performance and life.

Metal and metal nitride precursors are mainly used for capacitor electrodes, gate transition layers, and isolation materials in storage and logic chips, which are conducive to the preparation of smaller capacitors; they can also be used as phase-change materials in phase-change memories, which can improve storage data speed.

The Global High-k and CVD ALD Metal Precursor Market Size was estimated at USD 568.89 million in 2023 and is projected to reach USD 825.43 million by 2029, exhibiting a CAGR of 6.40% during the forecast period.
