## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on High Metallization Rate HBI competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global production of High Metallization Rate HBI reached approximately 8.93 million metric tons, with an average market price of around USD 280 per metric ton. The gross profit margin for producers ranges from 35% to 50%, influenced by natural gas costs, energy efficiency, and access to high-grade iron ore. Single HBI production plants can output 1.0 to 2.5 million tons annually using direct reduction processes (e.g., MIDREX or HYL/Energiron technologies). High Metallization Rate HBI (Hot Briquetted Iron) is a premium form of direct reduced iron (DRI) compressed into dense, solid blocks at high temperature to prevent re-oxidation. It features a metallization level exceeding 92%, low impurities (especially sulfur and phosphorus), and high metallic iron content, making it an ideal feedstock for electric arc furnace (EAF) steelmaking. HBI is easier to transport and store than gaseous or powdered forms of DRI and is used globally by mini-mills and integrated steel plants seeking high-quality, consistent scrap substitutes.

The global High Metallization Rate HBI market size was estimated at USD 2500.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.80% during the forecast period.
