Abstracts

Polyester Dipped Cord Fabric is an important skeleton material for tire casings. It is a tire skeleton fabric woven with strong strands as warp and medium and fine single yarns as weft. The warp is arranged closely and the weft is arranged sparsely, resembling a cord. The warp is also called cord, which bears the load, and the weft fixes the position of the warp, hence the name cord fabric. It is mainly used for the single-layer or multi-layer rubber-coated cord part of the tire skeleton, and requires good impact resistance and flex resistance. Cord fabric is only used on semi-steel radial tires, not on all-steel and bias tires. The production process of polyester dipped cord fabric mainly includes warp knitting, gluing, drying, pre-baking, re-dipping, re-drying, baking, post-processing, finished product finishing, finished product inspection, etc. Polyester dipped cord fabric has the characteristics of high strength, good heat resistance, good fatigue resistance and stable structure. It is widely used in the production of high-performance tires such as automobile tires, engineering vehicle tires, and aircraft tires. With the continuous improvement of tire radialization rate, the demand for polyester dipped cord fabric is also increasing.

The global Polyester Dipped Cord Fabric market size was estimated at USD 671.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.70% during the forecast period.
