Abstracts

The High Molecular Permanent Antistatic Agent is a chemical compound used to impart antistatic properties to various materials, typically in the form of polymers or textiles. It is a high molecular weight substance that is added during the manufacturing process to reduce or eliminate the build-up of static electricity on the surface of the material. The antistatic agent forms a thin, conductive layer on the surface, allowing the dissipation of static charges by providing a pathway for the electrical current to flow. This helps to prevent issues such as electrostatic discharge (ESD), dust attraction, and fabric clinging, making it valuable for industries like electronics, textiles, packaging, and automotive.

The global High Molecular Permanent Antistatic Agent market size was estimated at USD 185.25 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.80% during the forecast period.
