Abstracts

A high and low temperature coolant circulation machine is a device used to provide high and low temperature control. It regulates the temperature required during experiments, testing, or production processes by circulating coolant, and maintains a constant temperature environment. High and low temperature coolant circulation machines usually have the following functions and characteristics: high and low temperature range: High and low temperature coolant circulation machines can provide a wide range of temperatures, including high and low temperatures. The high temperature range can reach several hundred degrees Celsius or above, while the low temperature range can usually reach tens of degrees Celsius below zero. Temperature control accuracy: The high and low temperature coolant circulation machine has high temperature control accuracy and can maintain a stable temperature within the set temperature range. It is usually possible to achieve small temperature fluctuations and temperature gradients. Circulating coolant: the high and low temperature coolant circulating machine circulates coolant (usually liquid circulating medium, such as water or specific coolant) to the tested equipment or experimental devices through the built-in circulating pump to absorb heat and maintain temperature stability. Safety protection: High and low temperature coolant circulation machines are usually equipped with various safety protection functions, such as over temperature protection, over current protection, leakage protection, etc., to ensure the safety of equipment and users. Multi channel output: Some high and low temperature coolant circulation machines have multiple temperature control channels, which can provide different temperature control for multiple devices or experimental devices simultaneously. High and low temperature coolant circulation machines are widely used in fields such as scientific research, engineering testing, material preparation, pharmaceutical production, semiconductor technology, and chemical industry. It can provide a stable high and low temperature

environment to meet the requirements of temperature control in various experiments, tests, or production processes, to ensure the accuracy of experimental results, the stability of product quality, or the normal operation of equipment.
