Report Overview

The proportion of nickel in the electrode material of the high nickel ternary battery is higher. The proportion of nickel, cobalt and manganese in the high nickel 811 battery, which is the positive electrode material, has become 80%, 10% and 10%, which not only reduces the cobalt content. The ratio makes the cost controllable, guarantees the energy density of the battery to a certain extent, and greatly improves the battery's cruising range and the battery's cycle life and safety. In terms of performance, the higher the nickel content, the more room for the energy density of the power battery to increase. By increasing the proportion of nickel, not only can the energy density of the battery be increased, but also the use of cobalt can be reduced, which to a certain extent alleviates the cost pressure caused by the increase in material prices.
