Abstracts

High oxygen dive computers, also known as nitrox or enriched air nitrox (EANx) computers, are specialized electronic devices worn by divers to monitor and calculate real-time dive parameters including depth, time, and oxygen exposure while using breathing gases with elevated oxygen concentrations (typically ranging from 22% to 40% or higher, as opposed to the standard 21% found in air). These instruments are essential for managing oxygen toxicity risks, as increased partial pressures of oxygen at depth can lead to central nervous system toxicity; they track oxygen uptake through oxygen sensors or user-input gas mixtures, adjust no-decompression limits dynamically, provide warnings for maximum operating depths specific to the gas blend, and often integrate air and nitrox modes to support a range of diving activities from recreational to technical diving.

The global High Oxygen Dive Computers market size was estimated at USD 180.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.50% during the forecast period.
