Abstracts

A high-performance mobile edge computing platform is a computing architecture that combines powerful computing power and low-latency data processing capabilities, deployed at the edge of the network (such as base stations, routers, smart devices, etc.) to support real-time applications and services. This platform can process and analyze data close to the data source, reduce data transmission delays, and improve response speed. It is suitable for scenarios such as autonomous driving, smart transportation, Industrial Internet of Things (IIoT), 5G networks, etc. that have extremely high requirements for timeliness and computing power. With the popularization of 5G technology and the surge in IoT devices, high-performance mobile edge computing platforms have become a key technology to meet the needs of low latency and high bandwidth. By sinking computing resources to the edge of the network, enterprises can achieve faster data processing and real-time decision-making, and promote innovation in areas such as autonomous driving, smart manufacturing, and smart cities. However, the deployment and management of the platform also face challenges, such as resource allocation optimization, security assurance, and cross-platform compatibility, which requires technology vendors to work closely with industry users to jointly promote the development of technology standards and application ecology.

The global High-Performance Mobile Edge Computing Platform market size was estimated at USD 6960.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 16.90% during the forecast period.
