Abstracts

The spherical roller bearing is a type of rolling bearing featuring double rows of rollers. Its outer ring has a single shared spherical raceway, while its inner ring has two raceways inclined at an angle relative to the bearing axis. This structure imparts self-aligning capabilities to the bearing, enabling it to automatically compensate for shaft center deviations and bending of the housing or shaft. It is less susceptible to misalignment errors between the shaft and the bearing housing or shaft bending. It can function normally even when the shaft bends under load or when the installation is not concentric. High-performance spherical roller bearings exhibit superior performance in terms of load capacity, self-aligning capability, rotational speed adaptability, precision retention, and reliability. They can withstand radial loads, bidirectional axial loads, as well as combined loads.

The global High-performance Spherical Roller Bearings market size was estimated at USD 3722.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
