Abstracts

A high-power beam collector is a device specially designed to process high-energy light beams or particle beams. Its main function is to collect the remaining beam injected into the target chamber by the cyclotron, and in the extreme case of the target being penetrated, collect the beam to ensure that other parts of the system are not damaged. High-power beam collectors usually use high-melting-point materials as the part that receives beam bombardment, and use high-thermal-conductivity materials to transfer heat to the cooling system to maintain stable operation of the equipment. At present, the demand for high-power beam dumps is increasing worldwide.
