## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on High Power COS Tester competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. The High Power COS Tester is an integrated semiconductor laser chip characterization system, primarily used for testing the performance of packaged high-power COS semiconductor laser chips. Equipped with a temperature-controlled test platform, the system can automatically and accurately measure parameters such as optical power, voltage, current, wavelength, far-field divergence angle, and polarization characteristics, while also integrating facet defect inspection capabilities. Its testing functions include LIV curves, spectra, far-field distribution, polarization extinction ratio, and other key indicators; automatic OCR recognition of chip IDs or substrate IDs enables data binding to specific chips; it supports both wafer tray and aging fixture loading methods, and can automatically sort chips into bins based on test results. The dual-station parallel testing design doubles the UPH (units per hour). While ensuring high-precision testing, the system can automatically classify results as good or defective, significantly improving testing efficiency and consistency, and is widely used in chip performance testing, reliability evaluation, and R&D. In 2024, the global production of High Power COS Testers was 2,005 units, with an average price of USD 37,500 per unit, an average corporate gross margin of 35.3%, and a single-line annual production capacity of 120 units.

The global High Power COS Tester market size was estimated at USD 75.2 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 10.50% during the forecast period.
