Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on High-Power Potentiostat competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global production of High-Power Potentiostat reached approximately 12,000 units, with an average selling price of approximately US\$14,000 per unit. Single-line production capacity is approximately 1,000 units per year, with an average gross profit margin of approximately 30-40%. Cost structure: core power hardware accounts for approximately 30%-40%; precision control and measurement circuits account for approximately 20%-25%; R&D and software amortization account for approximately 15%-25%; structural components and cooling systems account for approximately 10%-15%; and remaining production management and marketing costs account for approximately 10%-15%. High-Power Potentiostat is an electronic device capable of applying and precisely controlling high currents and high voltages for electrochemical measurements and applications (such as batteries, electrolysis, and electroplating). It not only measures the electrochemical response current but also controls the applied potential. Its high power characteristics make it suitable for electrochemical analyses requiring high currents and high cell voltages. The upstream mainly includes core components and materials, such as high-power transistors IGBT, precision operational amplifiers, transformers, rectifiers, control boards (PCBs), high-precision reference electrodes and various metals and insulating materials, which together determine the performance, accuracy and reliability of the equipment; the downstream covers a wide range of application fields and end customers, including cathodic protection of oil and gas pipelines and storage tanks, anti-corrosion systems for ships and ports, metal electroplating and electrolysis industries, electrolysis of water to produce hydrogen/fuel cell testing in the new energy field, as well as basic electrochemical research and

material testing conducted by scientific research institutes and universities. The needs of these downstream industries directly drive the iteration of upstream technologies and the market direction of products.

The global High-Power Potentiostat market size was estimated at USD 168.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.20% during the forecast period.
