Abstracts

High power supercapacitors, also known as ultracapacitors or electrochemical double-layer capacitors (EDLCs), are energy storage devices that bridge the gap between traditional capacitors and batteries by offering exceptionally high power density, rapid charge and discharge capabilities, and long cycle life, typically exceeding one million cycles. Unlike batteries, which store energy chemically, supercapacitors store energy electrostatically at the electrode-electrolyte interface, enabling them to deliver or absorb large bursts of power in seconds, making them ideal for applications requiring frequent and intense energy pulses, such as regenerative braking in vehicles, grid stabilization, uninterruptible power supplies (UPS), and industrial machinery. They are characterized by their ability to operate across a wide temperature range, low internal resistance, and high efficiency, though they generally have lower energy density compared to batteries, limiting their use in long-term energy storage scenarios.

The global High Power Supercapacitors market size was estimated at USD 1280.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 19.45% during the forecast period.
