### Report Overview

High-precision automatic potentiometric titrator is an essential analytical instrument designed according to the principle of potentiometric method for quality control and chemical analysis of volumetric analysis. The appropriate indicator electrode and reference electrode are selected to form a working battery with the measured solution. With the addition of the titrant, the concentration of the measured ions changes continuously due to the chemical reaction, so the potential of the indicator electrode changes accordingly. In the vicinity of the titration end point, the measured ion concentration has a sudden change, causing a sudden jump of the electrode potential. Therefore, the titration end point can be determined according to the sudden change of the electrode potential. The high-precision automatic potentiometric titrator has high measurement accuracy. Titrant consumption can be significantly reduced without compromising the accuracy of the results.
