Abstracts

The high-precision base editing system is a gene editing technology that enables precise replacement or modification of single base pairs within a DNA sequence without cutting double-stranded DNA. The system primarily includes C-base editors and A-base editors, used to replace cytosine (C) with thymine (T) and adenine (A) with guanine (G), respectively. The high-precision base editing system boasts high editing accuracy and minimal off-target effects, making it widely used in gene therapy, genetic research, and agricultural biotechnology. Its downstream applications are primarily focused on life science research, precision medicine, agricultural breeding, and biopharmaceuticals. In scientific research, universities, research institutes, and genetic laboratories are using base editing systems to study gene function, analyze disease mechanisms, and conduct gene regulation experiments. In the medical and pharmaceutical fields, biopharmaceutical companies are using base editing to build disease models, develop gene therapies, and screen targeted drugs, promoting the development of personalized medicine and precision medicine. In agriculture and animal and plant breeding, companies and research institutions are using base editing to improve crop traits, enhance disease resistance, and increase yield, while also developing high-quality livestock and poultry breeds. With the maturity of gene editing technology and the improvement of relevant policies and regulations, high-precision base editing systems have broad application prospects in downstream markets such as scientific research, medical care, and agriculture, and have become an important tool for promoting the upgrading of the biotechnology industry. The gross profit margin of high-precision base editing systems is 52%. High-precision base editing systems represent the forefront of gene editing technology. Their core advantage lies in their ability to precisely modify single bases, significantly improving the efficiency and safety of genetic modification while reducing off-target risks. This technology not only provides a powerful tool for basic life science research but also demonstrates tremendous potential in applications

such as precision medicine, gene therapy, drug development, and agricultural crop improvement. With the continued optimization and commercialization of gene editing tools such as CRISPR and TALEN, high-precision base editing systems are expected to accelerate the development of disease treatments, promote the implementation of personalized medicine, and become a core competitive device in the biotechnology industry chain, providing strategic support for research institutions, pharmaceutical companies, and agricultural biotechnology companies.

The global High-Precision Base Editing System market size was estimated at USD 391.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 32.90% during the forecast period.
