Abstracts

The working principle of high-precision MEMS gyroscopes is mainly based on the Coriolis force effect. When an object moves radially in a rotating reference frame, it will be subjected to a tangential force perpendicular to the direction of radial motion, which is the Coriolis force. In MEMS gyroscopes, a vibrating mass block is usually used to generate this radial motion, and the angular velocity is calculated by measuring the change in the vibration direction of the mass block caused by the Coriolis force.

The global High-precision MEMS Gyroscope market size was estimated at USD 151.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 9.10% during the forecast period.
