Abstracts

High-pressure dry powder briquette machine is a high-end product in the briquette machine family. It can press various loose powders (such as metal ore powder, metallurgical waste, etc.) into spherical, egg-shaped or square blocks through forced pressurization and precision processing without adding water and adhesives. High-pressure dry powder briquette machine does not need to add water during the production process, which makes it particularly suitable for processing materials that are easy to deteriorate or difficult to dry when exposed to water. Due to the use of high-pressure forced pressurization technology, high-pressure dry powder briquette machine can press powders tightly together to form spherical products with high density and high strength. High-pressure dry powder briquette machine is widely used in industries such as metallurgy, chemical industry, coal and refractory materials. In the metallurgical industry, it is mainly used to process various waste and auxiliary materials, press them into blocks and then directly enter the furnace for smelting; in the chemical industry, it can be used to process various powdered raw materials to make spherical products with high density for subsequent processing and use; in the coal industry, it can also be used to press materials such as coal powder into blocks to improve combustion efficiency and environmental protection performance.

The global High Pressure Dry Powder Ball Press market size was estimated at USD 1210.34 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 3.30% during the forecast period.
