Report Overview

High pressure grinding roller is used for size reduction of ores, minerals and rocks. It compresses the feed material between two rotating rollers, one of which floats and other one remains in a fixed position. HPGR is mainly used in pellet feed to increase the specific surface area of the particles, to allow for strong pellets. This is in contrast to normal comminution applications, where size reduction is the main purpose. In pellet feed application, HPGR competes with dry ball mills, which consume more energy. HPGRs are commonly used in cement, ore and mineral processing industry.
