Abstracts

High pressure mercury lamps are a type of gas-discharge lamp that produce light by passing an electric current through vaporized mercury under high pressure, resulting in a bluish-white light output with significant ultraviolet emission. These lamps are characterized by their long operational life, high luminous efficacy compared to incandescent alternatives, and relatively simple, robust construction, making them historically significant in applications such as street lighting, industrial and commercial area illumination, ultraviolet curing processes in printing and coatings, and as a source for photochemical reactions. While they have been largely superseded in general lighting by more efficient and color-balanced technologies like metal halide, high-pressure sodium, and LEDs, high pressure mercury lamps remain in use in niche applications where their specific spectral properties, durability, or cost-effectiveness for certain UV processes are advantageous.

The global High Pressure Mercury Lamp market size was estimated at USD 320.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of -3.75% during the forecast period.
