Abstracts

A high pressure mixing head is a precision-engineered component used in polyurethane processing and other reactive polymer systems, which meters, mixes, and dispenses two or more high-viscosity liquid components?typically polyol and isocyanate?under high pressure to initiate a controlled chemical reaction that forms polyurethane foam, elastomers, adhesives, or coatings. It operates by forcing the components through small impingement nozzles or a mixing chamber at pressures often exceeding 100 bar, ensuring turbulent flow for homogeneous mixing without mechanical agitators, thereby minimizing waste, preventing premature curing, and enabling consistent product quality in applications ranging from automotive seating and insulation panels to footwear and furniture manufacturing.

The global High Pressure Mixing Head market size was estimated at USD 520.75 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
