Abstracts

High purity barium carbonate is a white, odorless, and heavy inorganic compound with the chemical formula BaCO_3 , typically characterized by a minimum purity level of 99% or higher, which distinguishes it from standard or technical grades. It is primarily produced through the precipitation method involving barium sulfide and sodium carbonate, followed by purification processes to eliminate impurities such as strontium, iron, and chloride ions. This compound is insoluble in water but soluble in most acids, decomposing to release carbon dioxide, and it is widely utilized in specialized applications including the manufacturing of precision electronic ceramics (such as multilayer ceramic capacitors), optical glass, ferrite magnets, specialty chemicals, and as a raw material in the production of other high-purity barium compounds where stringent chemical consistency, low trace element content, and specific physical properties are critical to end-product performance and reliability.

The global High Purity Barium Carbonate market size was estimated at USD 520.75 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
