Abstracts

High purity copper targets are specialized materials used in physical vapor deposition (PVD) processes, particularly in the production of thin films for the semiconductor, display, and photovoltaic industries. These targets, typically composed of copper with purity levels exceeding 99.99% (4N) or even 99.999% (5N), are essential for creating highly conductive, uniform, and reliable metallic layers in electronic devices such as integrated circuits, flat-panel displays, and solar cells. The stringent purity requirements ensure minimal impurities that could compromise electrical performance or film integrity, while the targets' physical properties—including density, grain size, and microstructure—are carefully controlled to meet the exacting standards of advanced manufacturing processes.

The global High Purity Copper Target market size was estimated at USD 220.45 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.50% during the forecast period.
