Abstracts

High-purity dysprosium refers to metallic dysprosium with a high purity. High-purity dysprosium is a silvery-white metal with a metallic luster. It is soft and can be cut with a knife. The density is about 8.55 g/cm³. The melting point is 1412°C and the boiling point is 2562°C. High-purity dysprosium is quite stable in the air, but it is easily oxidized by air and water at high temperatures to produce dysprosium trioxide. It can react quickly with water and dissolve in acid. High-purity dysprosium is usually prepared by methods such as vacuum distillation, which can effectively improve the purity of the metal to meet the needs of specific applications.

The global High-purity Dysprosium market size was estimated at USD 142.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.30% during the forecast period.
