Abstracts

High purity metals for semiconductor targets are metallic elements or alloys manufactured to rigorous cleanliness and homogeneity standards for use as sputtering or evaporation targets in semiconductor PVD processes. Produced via refining, vacuum melting, powder metallurgy and densification (e.g., HIP), these materials exhibit ultra-low impurity and gas contents, controlled microstructure, and stable thermal-mechanical properties. They enable precise film stoichiometry, consistent deposition rates, and repeatable yield in wafer processing, interconnects, and functional thin films. Certification and analytical reports (ICP, GDMS, LECO) typically accompany semiconductor-grade targets, and manufacturers also control particle size, density and surface finish to match tool specifications. The gross profit margin of the high-purity metal semiconductor sputtering target industry is approximately 5%–15%. Cost structure: Raw materials account for approximately 60%–80%, with precious metals making up an even larger proportion; manufacturing costs account for approximately 20%–30%; and the remainder is labor costs. Industry chain: Upstream industries include mining and metal smelting; downstream industries include wafer fabs, packaging and testing facilities, and display manufacturing plants.

The global High Purity Metals for Semiconductor Target market size was estimated at USD 1451.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.70% during the forecast period.
