Report Overview

Nano silicon powder is used in the negative electrode material of rechargeable lithium batteries, or graphite is coated on the surface of nano silicon powder as the negative electrode material of rechargeable lithium batteries, which improves the capacitance and charge discharge cycle times of rechargeable lithium batteries. Due to the high absorption rate of nano silicon for lithium, the capacity of lithium battery can be greatly improved by using nano silicon for lithium battery (the theoretical value can reach 4000mAh/g). The surface of nano silicon powder is coated with graphite (carbon nanotube or Graphene) to form Si-C composite materials, which can effectively reduce the expansion of silicon when absorbing lithium ions, increase the affinity with electrolyte, facilitate dispersion, and improve cycling performance.

The global High Purity Nano Silicon Powder market size was estimated at USD 285.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 12.45% during the forecast period.
