Abstracts

High purity phosphine gas, typically defined as phosphine (PH₃) with a purity level of 99.995% or higher and extremely low concentrations of impurities such as moisture, oxygen, and other hydrides, is a specialized chemical compound primarily used in the semiconductor and electronics industries as a crucial dopant gas in the production of compound semiconductors like gallium phosphide (GaP) and indium phosphide (InP), where it enables precise control over electrical properties during epitaxial growth processes such as metalorganic chemical vapor deposition (MOCVD); it also finds niche applications in the synthesis of certain specialty chemicals and pharmaceuticals, though its highly toxic, flammable, and reactive nature necessitates stringent handling, storage, and transportation protocols, often requiring advanced purification technologies and dedicated supply chains to meet the exacting standards of end-users.

The global High Purity Phosphine Gas market size was estimated at USD 112.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.25% during the forecast period.
