Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on High Purity TEB competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. High Purity TEB (Triethylboron) is a highly reactive, colorless, pyrophoric organoboron compound (chemical formula: $B(C_2H_5)_3$) refined to ultra-high purity levels (typically >99.999%) for use in semiconductor manufacturing. It is primarily used as a boron source in chemical vapor deposition (CVD) and atomic layer deposition (ALD) processes to dope silicon and deposit boron-containing films. Due to its excellent volatility and controllability at low temperatures, high-purity TEB is especially suitable for forming p-type doped layers in advanced logic and memory devices. It enables precise boron incorporation with minimal contamination risk, making it critical for applications requiring tight doping profiles and ultra-clean process environments.

The global High Purity TEB market size was estimated at USD 153.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.10% during the forecast period.
